Professional Summary

Full Stack Developer and founder of Reuel's Web Services, with over 2 years of experience delivering production-grade applications for local clients. BSc Computer Science graduate from the University of Technology, Jamaica (2025). Skilled in the React/Node/PostgreSQL stack with hands-on experience in cloud infrastructure, real-time systems, and CI/CD pipelines.

Technical Skills

Programming Languages: TypeScript, JavaScript, Python, Java, PHP, C#, C, Ruby

Frontend: React, Next.js, Vue.js, Angular, Tailwind, Tanstack, Zustand, Zod, shadcn/ui

Backend: Node.js, Express, Fastify, PostgreSQL, MongoDB, Redis, BullMQ, Anthropic API, OpenAI API, PrismaORM

Tools and Software: Git, Docker, Turborepo, Railway, Vercel, AWS (S3, SES, CloudFront), Sentry, Uptime Robot

DevOps and CI/CD Tools: GitHub Actions, GitLab, VSCode, AWS, ESLint, Prettier

Core Competencies: Full Stack Development, REST API Design, PWA & Offline-First Architecture, Cloud Infrastructure, Database Design, AI Integration

Experience

Founder & Full Stack Developer | Reuel's Web Services | 2023 – Present

Founded and currently operates a freelance software development consultancy serving local and regional clients across Jamaica and the Caribbean. Responsible for the full project lifecycle on every engagement: scoping requirements, architecting the frontend and backend systems, building and testing, deploying to production, and handing over to the client. Every project ships as a real product with real users.

- Architected and launched Pongs Shipping (pongsshipping.com), a full-featured freight forwarding and logistics platform, by engineering end-to-end shipment lifecycle management from pre-alert submission to in-country collection, eliminating spreadsheet-based tracking for a team of 6–15 staff and centralizing operations into a single real-time system.
- Delivered Jewels and Time, a custom headless CMS and storefront to replace an underperforming WooCommerce setup, by building an intuitive product management system handling 100+ SKUs with auto-generated SEO meta tags and smart slug creation, and introducing a lead scoring algorithm that replaced pen-and-paper contact tracking, giving the client their first structured sales pipeline.
- Built Rasta Collections (rastacollections.store) from the ground up for a client with no prior web presence by engineering a custom storefront and CMS that mirrors a full e-commerce experience while routing purchases through existing eBay listings. This eliminated the need for payment infrastructure while establishing a professional brand presence.
- Developed and launched Dutchie (dutchpot.online), a community-driven Caribbean recipe platform, by designing and building a reputation-based content system with user submissions, ratings, and community interaction. The aim is to ensure recipe authenticity while delivering a fully solo built, production ready fullstack application.
- Designed and delivered ByteGrade, an AI-powered automated code grading system, by building a full-stack React / C# .NET application integrated with the OpenAI API to automatically grade submissions, generate structured feedback, and detect plagiarism. It was validated through a 93% response rate survey of 280 students and live lecturer testing, directly replacing UTech's manual grading process and a basic autograder that provided no qualitative feedback.

Education

Bachelor of Science in Computing: Computer Science | University of Technology, Jamaica | 2019 - 2025
